

Git Contribution Tutorial

1. Preparation: The Fork and Clone

Before contributing, you must fork the project. This copies the repository to your own account.

```
git clone <your-fork-url>
cd <repository-name>
git remote add upstream <original-repo-url>
```

2. Syncing Your Local Copy

Always ensure your main branch is current with the project maintainer's work:

```
git checkout main
git pull upstream main
```

3. Creating a Work Branch

Never commit directly to main. Create a feature branch for your specific task:

```
git checkout -b your-feature-branch-name
```

4. Modifying and Committing

Make your code changes, then check the status to see what you modified:

```
git status
git add .
git commit -m "Describe your contribution clearly"
```

5. Pushing and Pull Requesting

Push your branch to your forked repository on GitHub, then visit the original repository to open a Pull Request.

```
git push origin your-feature-branch-name
```
